Hi All.

Who searches blogs, right? It turns out I do. I had to find something from last October, which meant guessing which page of posts it might be on and then clicking on random ones until I got to the right date range. If I hadn't known a date

havenwood opened this pull request 3 days ago

Refactor Class#subclasses methods.

No one is assigned | No milestone

Refactored Class#subclasses methods to make use of #reject, #select and #delete_if rather than explicitly creating, populating, and returning Arrays.

✔ **Good to merge** — The Travis CI build passed (**Details**)

Open

Empact commented 3 days ago

Not sure how important the performance considerations are here, but you can avoid rebuilding the arrays by operating in-place with `#uniq!`, `#select!`, etc.

havenwood commented 3 days ago

@**Empact** ObjectSpace.each_object returns an Enumerator not an Array so no #select! method.

Using #uniq! would mean setting a `descendants` local variable so you can then modify the receiver and return `descendants`. A microbenchmark shows nominal speed difference but mileage may vary:

```
>> no_bang = Benchmark.measure do
 |   1000.times do
 |     ObjectSpace.each_object(Class).select do |k|
 |       k < Integer
 |     end.uniq
 |   end
 | end
=>   0.210000   0.010000   0.220000 (  0.215000)
```

@mentions

dsorkin commented 2 months ago

@chrishunt I think the issue here was that the dates on the 50 seat expired license were overriding the actual 220 seat license. We likely discovered this when becoming the organization to help them with an upgrade.

danishkhan commented 2 months ago

yup what **@dsorkin** said.

WE USE @mentions ALL THE TIME

"Look at my Pull Request."

README.md

Culture Tools!

Hubbers work in vastly different ways than other places. Because of this, existing tools are rarely good enough and do not provide the right flows for how hubbers work. So we make our own!

Culture tools are more than just sloppy internal tools. Their character is driven by the culture of GitHub. We love urls, mentions, subscriptions, autocompletion, markdown, emoji, accessibility, simplicity, and BEAUTY. These aren't just features we want. These are features we expect. These are features that let us work the way we

Scripts To Rule Them All

We have a lot of projects. We have a lot of hubbers. Hubbers love contributing. What better way to lower the bar to contributions than ensuring some expecations for bootstrapping our projects. So let's add some healthy normalization to our scripts.

Hubbers should be able to have a certain set of expectations when setting up a project to work on it. While Boxen gets us close, all projects will still have their own `scripts`.

While every app is different, every app should use the basic patterns for their scripts.

Background

After a clone, obviously some things need to be done.

culture-tools

script/bootstrap

`script/bootstrap` should do nothing but fulfill dependencies.

All other scripts will just call this to get dependencies fulfilled.

Example

```
#!/bin/sh

set -e
export CC=gcc

echo "==> Installing gem dependencies…"
bundle check --path vendor/gems 2>&1 > /dev/null || {
  bundle install --binstubs bin --path vendor/gems --quiet
}
```

script/setup

`script/setup` contains any initialization for the project outside of the Ruby (or other) environment.

- DB creation
- Data Seeds
- App domain specific data seeding
- Etc.

Example

```
#!/bin/sh

set -e
export CC=gcc

script/bootstrap

echo "===> Setting up DB..."
bin/rake db:reset

if [ -z "$RACK_ENV" ] && [ -z "$RAILS_ENV" ]; then
  # Only things for a development environment will run inside here
fi

echo "==> The app is now ready to go!"
```

But wait, there's one more thing

BOXEN

BOXEN

PROTECT YOURSELF, *FROM YOURSELF.*

Manage the dependencies of all of your apps in one place.

KEEP YOUR HEAD.

Worried you might miss out on a crucial update?

Don't! Each time you run your `boxen`, it automagically™ updates to the latest release.

A FUTURE, *WITH JETPACKS.*

Need a few different databases and languages to run your apps?

We've got you covered. They're just a few lines of code away.

JUST ADD FIRE.

Fully configurable, insta-dev environments for you and yours. You can even install Minecraft with it.
